TransLution™ Software Additional Functions

Expanding the Functions & Features of TransLution™

Extended functionality within TransLution™ Software

TransLution™ Software is well established as both a complete Warehouse Management and Production Management system. Clients from a wide range of industries use TransLution™ in their warehouses and on their shop floors to manage warehousing functions - from receiving and put-away to picking and dispatch - as well as production processes such as materials tracking and manufacturing.

However, TransLution™ also goes beyond these standard warehousing and production functions. TransLution™ has been purposely designed for configuration to meet specific client needs. That means that while the software is the same for each client, implementation can be customized and configured to meet your exact needs and processes. Workflow, data validation, bar code labels, document output, and integration with SYSPRO and various plant automation equipment, are all possible within the TransLution™ Software configuration engine, providing you with an exciting range of novel applications that will surprise you in their depth and scope, while maintaining ease-of-use for the end user.

Benefits of using TransLution™ Software

- Simplified and accurate data capture.
- High levels of configurability to solve unique problems.
- A range of options to export data to third party systems.
- A simple user interface in multiple languages.
- Integration with SYSPRO and the ability to post transactions directly.
- Replaces spreadsheets and clipboards, automating manual tasks and making management information available in real-time.
- Integrates to shop floor equipment, both to read data and to manage outputs.

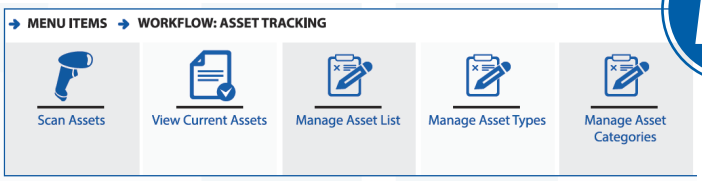

AVAILABLE ON

Asset Tracking

TransLution™ offers a simple-to-use and easy-to-roll-out Asset Tracking module that uses an Android phone or scanner to scan assets, and a Windows client to manage asset categories and report on Asset locations.

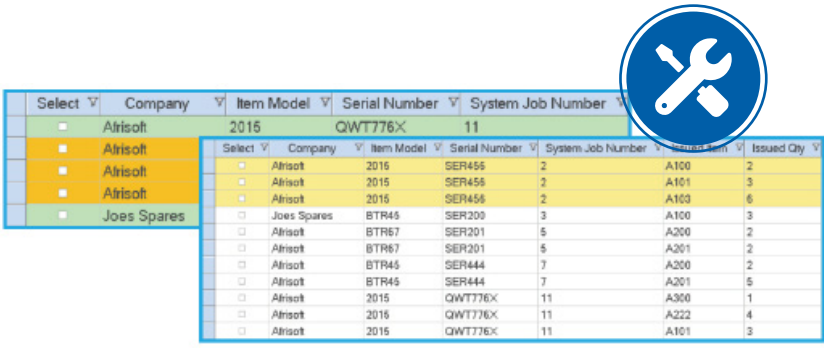

Labour Tracking

Users can log their productive and non-productive time on their own device or a shared device, while team leaders can validate time logged before posting to SYSPRO or simply generating reports for HR. Another key use for tracking labour could be to feed information through to planning and scheduling systems.

Repairs

We have a number of clients using TransLution™ to manage repairs processes. Items are brought in for repair and scanned and tracked through the evaluation, quoting, and repairs process, allowing clients to see the status of their product at any time. This is also called a Strip and Quote process.

Maintenance

TransLution™ can be used to manage both Planned and Unplanned maintenance processes.

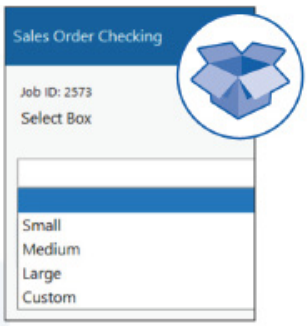

Proof of Delivery

By taking advantage of our Android features such as image capture, on-screen signing, and offline processing, TransLution™ is ideally positioned to assist with your proof of delivery functions

Packing and Checking

Often companies do not require a completely automated picking system, but they need to be able to supply detailed packing lists and parcel data to their clients and transporters. We have a large number of clients using TransLution™ for Packing and Checking processes.

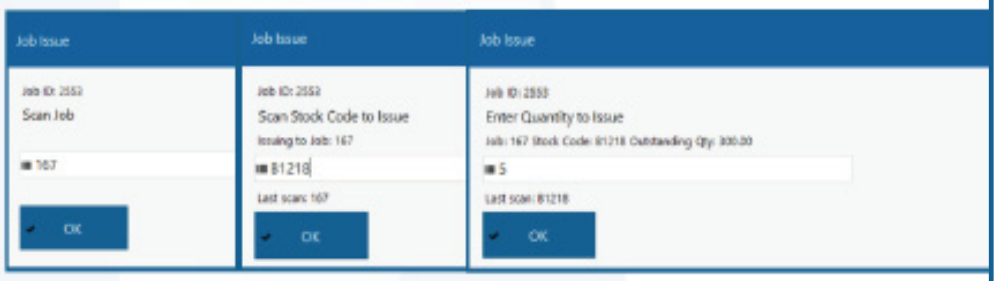

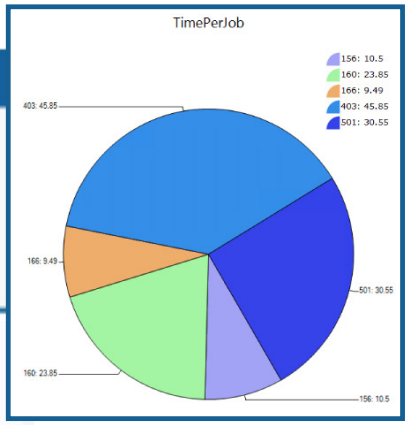

Document Tracking

More than one client uses TransLution™ to track documents through a process. In some cases, the documents are technical in nature such as engineering design documents, while in other cases they are related to people such as medical records. In all cases, where there is a need for a customizable tracking process, TransLution™ fits the bill.

Job Tracking

In the same way that TransLution™ can track documents and people, it can also track the progress of a job. In many environments, once a job enters the factory there is no visibility of the process until the finished products emerge at the other end. Using TransLution™ you can define various tracking points that are easy to use and don't require a complete redesign of your SYSPRO jobs and manufacturing stages. By tracking various points in the production process, you increase visibility, not only for your management team but also for third-party planning and scheduling systems.

Machine Interfaces

What many systems lack is the ability to integrate with different hardware. TransLution™ can integrate with a range of scales and other IoT units. This means TransLution™ can be used to weigh or count items, start and stop conveyors, or even switch on lights, for example. This ability to reach right down to the shop floor is unique to TransLution™.

Returns management

Often, organizations need to log information about returns that is not required by their ERP software. Rather than trying to extend the ERP software to cater for these custom requirements, TransLution™ can log all the data you need and only pass what it required on to the ERP for the necessary financial transaction to be performed.

THE TRANSLUTION™ ROADMAP

SYSPRO Integration

Leverage existing SYSPRO and inventory software investments: Use TransLution™ to seamlessly integrate information captured on the production floor and in the warehouse with your existing system. TransLution™ supports multiple devices such as wireless barcode scanners, touch-screen PCs and tablet PCs, and delivers data captured directly into the accounting world of SYSPRO.

Data Analysis & Reporting

Afrisoft Query Tool (AQT) searches internal and external databases and presents information in customised views on-screen, with drill-down, print, and export to spreadsheet capabilities. AQT further improves efficiency by automating processing, publishing and distributing query reports on a schedule for both internal and external users.

Production Planning & Scheduling

TransLution™ lays a solid foundation of data logging and labour tracking, facilitating advanced production planning and scheduling.

Supply Chain Integration

Business information created and stored in multiple software systems can be difficult to manage. Manual processing was historically the only way to integrate data from multiple databases. TransLutionTM can be used with DataSwitch to standardise and automate the flow of information between disconnected software systems within a business or with supplier and customer systems outside of the business.

TRANSLUTION™ PRODUCTS

TransLution™ EazyScan

EazyScan uses hand-held scanners to provide instant availability of process information, offering maximum control, increased information accuracy, traceability, reporting and improved decision making.

TransLution™ EazyTouch

EazyTouch runs on a standard PC or touchscreen where screens are configured to include only those operations relevant to each process, including buttons to print labels, view picking orders, stock count data, or reveal production instructions.

TRANSLUTION™ CLIENTS

TransLution™ services over 200 companies, and supports over 1800 mobile devices across multiple industry sectors:

- Food Processing & Manufacturing
- Automotive Components
- Textiles
- Steel Products Manufacturing
- Electrical Components
- Packaging
- Warehouse Management
